

Scottish Raptor Monitoring Scheme records of breeding success in 2023

N.B.: The following tables summarise data submitted to the Scottish Raptor Monitoring Scheme (SRMS) in 2023, providing additional detail to the [SRMS annual report](#). If you notice any errors or omissions please contact srms@bto.org. It is important to recognise that for many species and regions not all breeding pairs are monitored and the **numbers in the tables below do not represent entire populations or provide a complete picture of breeding productivity, at either regional or national scales**. To explore trends through time please consult the [trends available on the SRMS website](#), reports of the [Rare Breeding Birds Panel](#), results of the [Breeding Bird Survey](#) (for common species), and the national surveys for [Hen Harrier](#), [Golden Eagle](#), [Peregrine](#) and [Merlin](#).

Acknowledgements: We thank the hundreds of dedicated volunteers who contribute raptor breeding records to the Scottish Raptor Monitoring Scheme. We thank all scheme partners for their support and the partner representatives for their time and input to the running of the scheme. The BTO contribution to the scheme includes funding from gifts in Wills for which we are extremely grateful.

Description of main headings reported against in the following tables:

Region = Scottish Raptor Monitoring Scheme [regions](#) in bold and subregions in normal font.

Home ranges checked = Total number of home ranges that have been [checked for occupancy](#). This figure excludes records where no indication was given as to whether the home range was occupied or not and is therefore a minimum number.

Home ranges occupied by pairs = Number of home ranges that were found to be occupied by pairs.

Single birds or fresh signs = Number of additional home ranges that were found to be occupied by a single bird or where fresh signs of occupation were found but no birds observed.

Pairs monitored = Number of home ranges occupied by pairs that were [monitored](#), i.e. the outcome of the breeding attempt (success / failure) was recorded. This figure includes nests where large chicks were recorded and there was no subsequent indication that they did not fledge.

Pairs failing early or non-breeding = Number of pairs which produced no fledglings and were not known to lay eggs. This figure excludes records where it was not recorded whether eggs were laid (i.e. eggs laid was reported as Outcome unknown). The number is therefore likely to be a minimum.

Monitored pairs known to lay eggs = Number of monitored pairs laying eggs.

Monitored pairs known to hatch eggs = Number of monitored pairs hatching eggs.

Monitored pairs known to fledge young = Number of monitored pairs producing at least one fledgling. This figure includes pairs with young last seen at large chick stage where there was no subsequent indication that they did not fledge.

Minimum number of young fledged = Minimum total number of young fledged. This figure includes young last seen at large chick stage where there was no subsequent indication that they did not fledge.

Young fledged per pair = These “productivity” numbers are based on records with a numerical observation of fledged young (or large young with no subsequent indication that they did not fledge), i.e. records where large or fledged young are just recorded as “Yes” are not included. In a few instances, this means that no data were available to derive estimates of productivity, despite there being one or more (assumed) successful breeding attempts. Productivity values for these situations are expressed as “?” (rather than as “-”) or, for young fledged per successful pair, as “?” (n=0).
